10. Stability and reactivity

www.rxmarine.com

Reactivity Forms explosive mixtures with air on intense heating. A range from approx. 15 Kelvin below the flash point is to be rated as critical. The

following applies in general to flammable organic substances and mixtures: in correspondingly fine distribution, when whirled up a dust

explosion potential may generally be assumed

Chemical stability stabilised In case of decomposition in closed containers and tubes risk of bursting due to buildup of overpressure. The product is chemically stable

under standard ambient conditions (room temperature)

Possibility of hazardous reactions Violent reactions possible with: alkali hydroxides Strong oxidizing agents

Strong heating.
